

Name: _____ Section: _____

AEM 2011 Quiz #9
Tuesday, March 28, 2023

A non-communicating calculator is allowed. Full credit will only be given if all steps used are clearly communicated (free body diagrams, algebra, etc).

While constructing the new recreational-center building, the construction company erected a temporary platform as shown in the figure. The equipment kept on the platform at point B weighs 693 lb. The platform can be modeled as a truss.

Use the **method of sections** to determine the force in member AB. State whether the member is in tension or compression. (Clearly indicate the cut/section and draw the FBD of the portion under analysis.)

METHOD
OF SECTIONS

→ alternative soln:
solve rxn at D
and select ACD
as section.

reaction at E

$$\sum M_D = -693 \text{ lb} (16 \text{ ft}) + E_y (21 \text{ ft})$$

$$\rightarrow E_y = \frac{693 \text{ lb} (16 \text{ ft})}{21 \text{ ft}} = 528 \text{ lb}$$

analyze section BCE

$$\sum M_C = E_y (10.5 \text{ ft}) - F_{AB} (4.125 \text{ ft}) - 693 \text{ lb} (5.5 \text{ ft})$$

$$\rightarrow F_{AB} = \frac{528 \text{ lb} (10.5 \text{ ft}) - 693 \text{ lb} (5.5 \text{ ft})}{4.125 \text{ ft}}$$

$$F_{AB} = 420 \text{ lb C}$$

A non-communicating calculator is allowed. Full credit will only be given if all steps used are clearly communicated (free body diagrams, algebra, etc).

While constructing the new recreational-center building, the construction company erected a temporary platform as shown in the figure. The equipment kept on the platform at point B weighs 693 lb. The platform can be modeled as a truss.

Use the **method of sections** to determine the force in member AB. State whether the member is in tension or compression. (Clearly indicate the cut/section and draw the FBD of the portion under analysis.)

METHOD OF JOINTS

reaction at E (same as before)

$$\sum M_D = -693 \text{ lb}(16 \text{ ft}) + E_y(21 \text{ ft}) \rightarrow E_y = 528 \text{ lb} \uparrow$$

joint E (we are guessing if F_{BE} and F_{CE} are T/C but at least know must be opposite)

$$\alpha = \arctan\left(\frac{12}{16}\right) = 36.87^\circ$$

$$\beta = \arctan\left(\frac{12}{5}\right) = 67.38^\circ$$

$$\sum F_x = F_{BE} \cos \beta - F_{CE} \cos \alpha$$

$$\sum F_y = E_y + F_{CE} \sin \alpha - F_{BE} \sin \beta$$

$$\rightarrow F_{BE} = \frac{\cos \alpha}{\cos \beta} \left(\frac{F_{BE} \sin \beta - E_y}{\sin \alpha} \right) = \frac{\cos \alpha}{\cos \beta \sin \alpha} (F_{BE} \sin \beta - E_y)$$

$$= 3.2 F_{BE} - 3.47 E_y \rightarrow F_{BE} = 832.8 \text{ lb C}$$

(initial guess correct)

joint B

$$\gamma = \arctan\left(\frac{12}{16}\right) = \alpha = 36.87^\circ$$

$$F_{BE} = 832.8 \text{ lb}$$

$$\sum F_y = F_{BE} \sin \beta - 693 \text{ lb} - F_{BC} \sin \gamma$$

$$\rightarrow F_{BC} = 126.23 \text{ lb T}$$

$$\sum F_x = F_{AB} - F_{BE} \cos \beta - F_{BC} \cos \gamma$$

$$\rightarrow F_{AB} = 420 \text{ lb C}$$
